(57) Abstract :
The main purpose of this present invention is to secure the entire software from hacking and unauthorized person. The main design of our invention discloses a security framework integrated with LMS for software security, which comprises the security framework within the Learning Management System (LMS). Initially, when the bot login is done, then it generates the jumbled words, and once the user finds and enters the words from jumbled letters, then it checks the corresponding words in the dictionary. The learner should select the password's letter from the solved jumbled words. After that, authenticity verification is done to find out whether the password is valid or not. Finally, the authorization process is done for the user's access control in the learning management system. [To be published with Figure.1]
